Education & Careers

Hanyang University

Seoul, Republic of Korea

Ph.D. candidate in Electronic Engineering (GPA 4.3 / 4.5)

Mar. 2024 – Aug. 2027 (est.)

- Semiconductor Nanophotonics Laboratory
- Advisor: Prof. Mun Seok Jeong

Dongguk University

Seoul, Republic of Korea

M.S. in Solid-state Physics (GPA 4.5 / 4.5)

Sep. 2022 – Feb. 2024

- Advanced Physics on Electromaterial Laboratory
- Advisor: Prof. Kwun-Bum Chung
- Thesis: "Performance Control of InSnZnO/InGaZnO Multi-Channel-Layered Transistors with Defect Analysis of Amorphous Oxide Semiconductors"

Dongguk University

Seoul, Republic of Korea

B.S. in Physics (GPA 4.2 / 4.5)

Mar. 2016 – Aug. 2022

- Military Service in the Republic of Korea (Jun. 2019 – Apr. 2021)
- Undergraduate researcher in Advanced Physics on Electromaterial Laboratory (Jul. 2021 – Aug. 2022)

Scholarships & Awards

2022, 2023	Physics Department Alumni Scholarship	Dongguk University
2021	Dongguk 1.1.1 Scholarship	Dongguk University
2022, 2023	Dongguk Future Talent Scholarship	Dongguk University
2024	IC-PBL Graduate Championship, 3rd Place	Hanyang University
2025	HY-BrainKorea G3 Award, 2nd Place	Hanyang University

Skills

Spectroscopy	Optical spectroscopy (Raman, Photoluminescence), Ellipsometry, Deep-Level Transient Spectroscopy (DLTS), Tip-Enhanced Nanospectroscopy
Machine Learning	Physics-based data analysis, Deep learning for experimental data, Explainable Artificial Intelligence (XAI)
Simulation	Finite-Difference Time-Domain (FDTD) simulations, Inverse design with adjoint optimization
Others	Electrical characterization (I-V, etc.), X-ray Photoelectron Spectroscopy (XPS), Photolithography, Sputtering

Research

My research focuses on quantitative defect spectroscopy and experimental data analysis for two-dimensional (2D) materials and oxide semiconductors. I aim to extract physically meaningful parameters from electrical and optical measurements and relate them directly to material properties and device behavior, with an emphasis on interpretability and reproducibility.

1. Defect & Optical Spectroscopy

- Quantitative analysis of intrinsic and extrinsic defects in 2D materials and oxide semiconductors.
- Extraction of defect energy levels, densities, and carrier dynamics using Deep-Level Transient Spectroscopy (DLTS) and Photo-Induced Current Transient Spectroscopy (PICTS).
- Raman / Photoluminescence (PL) spectroscopy for probing defect states, doping, strain, and phase transitions.
- X-ray Photoelectron Spectroscopy (XPS) and spectroscopic ellipsometry (SE) for chemical composition, bonding states, and optical properties.
- Tip-Enhanced Raman Spectroscopy (TERS) for spatially resolved defect and structural inhomogeneity analysis beyond the diffraction limit.

2. Explainable Artificial Intelligence (XAI) for Experimental Data

- Development of analysis pipelines for spectroscopic and electrical datasets, including preprocessing, feature extraction, modeling, and validation.
- XAI to identify physically relevant data features.

- Connection of AI-extracted features to defect-related mechanisms and material properties under data-limited experimental conditions.

3. Advanced Electronic & Photonic Devices

- Fabrication and characterization of electronic devices based on 2D materials and oxide semiconductors, including logic and neuromorphic devices.
- Quantitative analysis of device electrical responses (e.g., I-V characteristics and transient behavior) to identify dominant transport and trapping mechanisms.
- Finite-Difference Time-Domain (FDTD) simulations to evaluate optical responses and electric-field distributions in nano- to micro-scale structures, supporting the design and analysis of photonic components.

My work integrates defect-resolved spectroscopy, explainable analysis of experimental data, and device-level characterization to obtain quantitatively grounded insight into solid-state materials. The primary objective is to extract physically meaningful parameters from measurements and connect them directly to material behavior and device performance.

Research Fellowship

NRF Basic Science Research Program

50 M KRW

Principal Investigator

Sep. 2025 – Aug. 2027

- Project: “Deep-Level Transient Spectroscopy and Nanospectroscopy for Ultrafine Defect Analysis Using Explainable AI in 2D Quantum Semi-conductors”
- Funded by the Ministry of Education through the National Research Foundation of Korea (NRF).
